Hi,

You can view my full resume here: [Resume \(PDF\)](#)

I'm writing to express my interest in the Junior Data Scientist position at Cloudfide. I have a strong foundation in Python and a genuine passion for machine learning, artificial intelligence, and building data-driven solutions. My practical experience involves working extensively with Large Language Models (LLMs), including crafting structured outputs and utilizing advanced techniques to integrate AI capabilities into automated pipelines. You can view examples of my technical projects and coding style on my [GitHub](#).

While I am at the beginning of my commercial data science journey, I have a solid understanding of machine learning concepts, NLP, and model evaluation. I have hands-on experience developing customized AI automation tools, utilizing Python and APIs to process data, generate insights, and automate complex workflows. Furthermore, my proficiency with Git and containerization technologies like Docker ensures I am well-prepared to adapt to modern cloud-native environments and MLOps practices.

I am highly motivated to expand my skills in Azure, Databricks, and computer vision within your team of passionate engineers. I thrive in environments where I can tackle real-world problems and continuously learn, and I am eager to contribute to delivering impactful solutions for your global clients.

I am based in Krakow, available for full-time cooperation, and would love to discuss how my proactive mindset and technical foundation can be a great asset to Cloudfide.

Cheers,

Oleh
