Hi,

You can view my full resume here: [Resume \(PDF\)](#)

I am an IT and Systems Engineer with a solid foundation in infrastructure automation, system administration, and network security, and I'm very eager to transition into a dedicated cybersecurity role.

My background is primarily in DevSecOps and IT support for creative studios, where I managed workstation lifecycles across both Windows and Linux. I've built and maintained secure environments, including setting up zero trust remote access with Cloudflare Tunnels and running continuous infrastructure monitoring with automated alerting. This experience gives me a practical understanding of OS internals, networking (like HTTP/S, TLS, and common ports), and diagnosing system issues.

I write scripts daily in Python, Bash, and PowerShell to automate complex workflows and system deployments. You can see some of my code on my [GitHub](#).

While I might not have direct experience working inside a SOC or using tools like CrowdStrike Falcon yet, I learn quickly. I hope you can see my strong systems administration background and scripting skills as a solid bridge to this role. I already spend a lot of time digging into logs to find the root cause of issues, and I am excited to apply this mindset to incident response and threat hunting.

I am based in Krakow and fully open to working in a 24/7 shift system. I would love to continue this conversation to see how I can best contribute to the Detection & Response team at Nomios.

Cheers,
Oleh
